This paper deals with an assessment of avifauna diversity and their migratory status in Sadashiv nagar of Belagavi city in North Karnataka, India. A weekly observation from September 2011 to August 2013 for the period of 2 years resulted in documentation of 75 bird species belongs to 16 orders, 39 families and 65 genera. Passeriformes alone represent 59% of the total bird species recorded followed by Ciconiiformes (5%) and Columbiformes (5%). Among the families Cistcolidae and Motacillidae consists maximum (5 species each) number of bird species followed by Ardeidae, Columbidae and Muscicapinae (4 species each). Out of total bird species recorded 35% found as resident, 29% were local migratory, 9% were winter visitor and 1% were summer visitor and rare.

Keywords: Sadashiv Nagar, Karnataka, Cistocolidae, Motacillidae, Avifauna diversity

INTRODUCTION

Indian subcontinent represents 1350 plus bird species consisting resident, migratory, rare, exotic, native, endangered and endemic birds. Karnataka supports 500 plus bird species with 48 were listed in threatened category. Further, avifauna diversity of South Karnataka is well documented (Ali 1942ab, 1943abc; Srinivasa et al. 1997; Aravind et al. 2001; Nazneen et al. 2001). Pande et al. (2003) documented the birds from Western Ghats, Kokan, Goa and Malabar region. There is scanty information available on bird diversity of North Karnataka. Recently, Donar et al. (2012) documented 49 bird species from Nippani reservoir and, Patil and Hiragond (2012) recorded 86 bird species from Shettilhalli in Belagavi district. Since, there is no published report on bird diversity of Belagavi city. It was planned to assess the avifauna diversity and

their migratory status in Sadashiv nagar of Belagavi city.

MATERIALS AND METHODS

Study Area

Belagavi city (15°52'N; 74°34'E) is situated nearly 762 m asl in North Karnataka, India. It receives around 1000 mm annual rain fall and temperature ranges from 10 to 34°C. Study area consist gardens, temporary ponds and rice paddy fields in outskirts of Sadashiv nagar along the Vengurla road. It also consist acacia plants, some patches of grass land, shrubs and several fruiting tree represented by almond, jack, mango, coconut, ficus, tamarind etc.

Method:

Regular weekly observations were made in different parts of the study area from September 2011 to August 2013 for the period of 24 months to record avifauna diversity. Study area was explored travelling on two wheeler vehicle as well as on foot. Birds were sighted during their peak activity from 6.30 to 10.30 hrs and 16.00 to 19.00 hrs. Birds sighted by opportunistic sighting are also added to the checklist. The birds were directly observed by 10

x 50 X Olympus binocular and identified using field guides by Ali (2002) and Grimmett et al. (2011). Some of the birds were photographed for identification. The Common and scientific names of birds are followed after Grimmett et al. (2011). Migratory status of birds was categorized in to resident –R (Birds recorded around the year), local migratory –LM (Birds showing local movements), winter visitor –WV (Birds recorded during winter), summer visitor –SV (Birds recorded during summer) and rare –Ra (Bird recorded only once during the study period). Status of threatened category of birds is adopted from BirdLife International (2013) and IUCN Red List of Threatened Species (2013).

OBSERVATIONS AND DISCUSSION

During the above study period Common pigeon *Columba livia* were regularly sighted around the year in 10-100 individual flocks whereas single Common hoopoe *Upupa epops* was sighted only once on April 7th, 2012 at 17.30 hrs. Rests of the birds were sighted singly / in pair / in 3-5 individual flocks. Above said survey resulted in documentation of 75 bird species belongs to 16 orders, 39 families and 65 genera (Table 1). This amounts to around 15% of the total bird species found in Karnataka. In present assessment Passeriformes contribute 59% (44) of

the total bird species recorded followed by Ciconiiformes and Columbiformes (4 bird species each). Falconiformes, Charadriiformes and Coraciiformes represent 3 bird species each; Cuculiformes, Strigiformes, Apodiformes and Piciformes consists 2 bird species each; Anseriformes, Podicipediformes, Gruiformes, Psittaciformes, Upupiformes and Bucerotiformes represent least (1) number of bird species (Figure 1). Among the families each of Cistridae and Motacillidae represents 7% (5 bird species) of the total bird species recorded followed by Ardeidae, Columbidae and Muscicapinae representing 5% (4 bird species) each. The detailed family wise bird species recorded are listed in table 2. All the birds recorded are least concerned. Southern Coucal *Centropus parroti* and Dusky Crag Martin *Ptyonoprogne concolor* were not assessed for threatened category of IUCN (IUCN, 2013; BirdLife International, 2013). Study area consist 35 (47%) resident bird species and 29 (39%) local migratory bird species showing local movements. Among the migratory bird species 9 (12%) were winter visitor and Black-headed Cuckooshrike *Coracina melanoptera* is summer visitor. Since, Common Hoopoe *Upupa epops* sighted once during the study period considered as rare (Figure 2).

Figure-2. Migratory status of bird species recorded in Sadashiv nagar: Belagavi city

Study area supports breeding activities to Red-whiskered Bulbul, Red-vented Bulbul, House crow and Black Kite. It is also noticed that, paired Black Kite showing their regular activities around the nest on a tree top from last 2 and 1/2 years indicating the birds using same nest year after year. Present assessment reveals that, Passeriformes dominating the bird community in the study area. This is due to the fruiting trees, flowering plants in gardens, temporary ponds, grassland patches supporting

frugivorous and insectivorous birds. The anthropogenic activities such as rapid urbanization mainly construction of residential, educational and commercial buildings in city leading to habitat loss i.e. permanent disappearance of wetland bodies and grass land patches, removal of trees for widening of roads etc. These activities become a major threat to avifauna biodiversity. Thus, there is an urgent need to take some measures to conserve wetlands bodies, gardens with flowering and fruiting trees and grass land patches in city to support avifauna.
