ABSTRACT

The present study was made to estimate avian fauna in and around the Shivaji University campus, where the survey has been conducted in 2014-2016. The present investigation was carried out to study avian diversity with aspect to ecological condition. Total number of 122 bird species belonging to 18 orders and 54 families were observed. Out of these 122 birds, 74 are residential, 44 are residential migratory and 4 is migratory. Three near threatened species were observed during the survey. Campus is rich in biodiversity and it is conserved by university. Measures should be taken to protect diverse habitat and avifauna of Shivaji University campus.

Key Words: : Shivaji University, Avian fauna, Conservation

INTRODUCTION

Birds are ecological indicators to understand the habitat quality. Bird diversity has been decreasing due to the destruction of natural habitats and anthropogenic activities (Grewal B.2000) .Shivaji University was a natural habitat with many small water bodies in and around and gardens where many species of birds, amphibians, reptiles, mollusks and arthropods are lived. The birds population fluctuated among sites in different seasons due to local environmentally dependent factors, local and regional habitat changes and climatic changes (Ericia, at, al 2005). The avifauna is important for the

ecosystem as they play various roles as scavenger, pollinators and predators of insect pest (Padmavati, et

al., 2010)The direct effect of avian population are the presence and abundance of water. According to Pande et.al reported species number from Maharashtra was 568 from 83 families and 20 orders many authors have contributed to avifaunal diversity and distribution records in Maharashtra since few decades. The present study

reports the avian diversity along with their residential and migratory status, and also their IUCN status. This study helps to prepare a baseline data on avifauna diversity with their relative abundance and occurrence in and around the Shivaji university campus.

Materials and Methods

Study Area:

The Shivaji University is situated at South-West of Maharashtra at 16°40'31.81"N and 74°15'12.10"E and is at altitude of 607m above sea level. The total area of the campus is about 853 acre and in this area there are lots of habitats are developed but majorly pond habitat, shrub habitat, forest habitat and some area is of barren land in which in winter the total area is covered with lots of diverse grass flowers so food and shelter is available out here for Fauna .Therefore area is rich in Biodiversity and it is conserved by University and there is low rush of people in campus (Figure-1). The Climate of campus is tropical with three distinct seasons' monsoon (June-October), winter (October-February) and summer (March-Mid June). The temperature ranges between 10°C to 37°C. There is no avian faunal study so far in Shivaji University campus.

Figure-1. Location of Shivaji University Kolhapur

Methodology:

Binocular Olympus 10*50 X, was used for close observation of birds and for photography Cannon-EOS 700 D camera, with Lens 55-250 mm. Book of Indian Birds by Salim Ali and Birds of the Indian Subcontinent by Grimmet; C.Inskipp; T.Inskipp were used as field guides and for preparing check list. Also bird survey was conducted according to a standard point count method. The data collected from the surveys were used to estimate diversity and status of bird species. The survey was conducted during March 2014 to May 2016. Survey was conducted for 3 days in a week in morning (7.00 am to 10.00am) and in evening (5.00 pm to 7.00pm).

RESULTS AND DISCUSSION

In present survey 122 species of birds from 18 orders with 54 families was observed. Out of which 74 were residential 44 are residential migratory and 4 birds were migratory. In total study we observed there are 3 species are near threatened as per IUCN Red List of Threatened Species Version 2011.1 http://www.iucnredlist.org. A seasonal variation is seen during the survey. Some are winter migratory while few are summer but in winter the occurrence and number are somewhat more than other months of the year because in winter the campus of university fully covered with grass, plenty of food is available and availability of water. Shivaji University has many small water bodies in

diversity so birds were attracted towards the campus area. In campus there is low rush of the people, plenty of food is available, sheltered, etc are good for the conservation of avian fauna.

and around the campus it also has great variety of fauna

Cattle egret, little egret, Indian pond heron, little cormorant are easily spotted in study area. Some rare species like Grey heron, Purple heron were also spotted in the study area (Figure-2).

Ashy Prinia (Prinia socialis)

Purple Rumped Sunbird (Nectarinia zeylonica)

Blue rock pigeon, spotted dove, rose ringed parakeet are very common throughout the year. Barn owl and spotted owl are spotted during night. White breasted

Grey hornbill (Ocyceros birostris)

Tailor bird (Orthotomus sutorius)

Indian hanging parrot (Loriculus vernalis)

Baya weaver (Ploceus philippinus)

Pied crested cuckoo (Clamator jacobinus)

Indian peafowl (Pavo cristatus)

Grey heron (Ardea cinerea)

Paddyfield pipit (Anthus rufulus)

White breasted kingfisher (Halcyon smyrnensis)

kingfisher, pied kingfisher, green bee eaters are very common birds in and around the campus. Minivets, babblers, mynas, robins, and sunbirds are more in number in university campus area. Birds such as lapwings and larks were found using wetland habitat extensively for nesting in their breeding season (Narwade et.al.in press).

CONCLUSION

The presence of resident and migrant birds in and around the campus indicates that the habitat is rich enough to attract birds and make them spend their life. Wetlands are relatively safe areas which provide the birds with abundance of food and safe place for roosting, nesting and moulting (Imran Dar et.al.in 2009). Campus of Shivaji University shows wetlands, grasslands, aquatic habitats which are provide rich flora and fauna. The results of the survey and observations highlight the fact that avifauna here is abundant which indicates healthy status of the campus area. Occurrence of number of birds in the study area, every year is excellent indicator of the state of favorable environment. Considering above facts there is need to aware the people about richness of the place and to take the steps towards conservation of such diversified avifauna.
